

Proof, not measurement.

A score describes an oversight process. A receipt establishes a narrower authorization fact.

THE ASSESSMENT QUESTION

Article 14 addresses effective human oversight, including the ability to disregard, override, reverse, intervene, or stop where appropriate. EMILIA does not provide the whole oversight program. It gives one configured control a durable answer to this narrower question:

Did a relying-party-pinned approver key authorize this exact consequential action, under the verified context, before the executor acted?

THE BRIGHT LINE

PROPERTY	SCORE, DASHBOARD, OR OPERATOR LOG	AUTHORIZATION RECEIPT
Artifact	A number or narrative about review	Signed evidence of the authorization event
Binding	Process or session-level indication	Exact material action fields and policy digest
Trust root	Usually the operator's database or service	Keys and policy inputs pinned by the relying party
Verification	Inspect the issuer's report	Recompute offline with published code and formats
Enforcement	Often advisory or post-hoc	Executor can refuse before effect
Tamper response	Depends on logging controls	Changed signed bytes fail verification
Replay	Usually outside the score	Atomic consumption can admit at most one use

What the evidence can establish

Signature and exact-action binding; pinned approver and policy inputs; WebAuthn RP ID, user-presence and user-verification flags in Class-A mode; distinct-signoff quorum where required; one-time consumption at the executor; tamper-evident retained decision records.

What must remain separate

Legal identity proofing, competence, comprehension, freedom from coercion, automation-bias controls, safe-state design, action correctness, complete routing through the Gate, retention adequacy, and the overall Article 14 assessment.

Honest status. The formats are described in active individual IETF Internet-Drafts, not adopted IETF standards. JavaScript, Python, and Go are same-team ports used for consistency checks. Formal models cover named core properties, not the entire deployment. This evidence can support an assessment; it cannot certify compliance.
