

Digital sovereignty includes evidence Europe can verify itself.

Control over infrastructure is incomplete when evidence of a consequential AI action remains inside the operator's dashboard. EMILIA provides an open, self-hostable way to retain action-authorization evidence that a European institution can verify against trust inputs it controls.

THE NARROW CONTROL

A deployer may require an enrolled person, or a policy-required quorum, to authorize the exact material action before an executor proceeds. The resulting receipt is portable and can be checked offline without calling the issuing service.

A valid receipt establishes that a relying-party-pinned key signed the exact action under a stated policy context. It does not, by itself, establish legal identity, comprehension, competence, correctness, lawfulness, or full regulatory compliance.

WHY THIS MATTERS FOR EUROPEAN INSTITUTIONS

Institution-held trust The assessor chooses and retains the approver, policy, log, revocation, and verifier trust inputs. The operator's assertion is not the root of verification.	Cross-boundary evidence The same artifact can travel from provider to deployer, auditor, insurer, court, or market-surveillance authority without requiring the original service to remain online.	Open implementation Specifications, code, vectors, and named formal-model claims are public and Apache-2.0. The protocol texts are active individual IETF Internet-Drafts, not adopted standards.
---	--	---

EU AI ACT EVIDENCE FIT

PROVISION	WHERE THE ARTIFACT CONTRIBUTES	WHAT REMAINS SEPARATE
Article 12 · Logging	Signed exact-action authorization, typed refusal, evidence-log chain, and deterministic period export.	Completeness, retention, access control, monitoring, and routing every relevant event through the control.
Article 14 · Human oversight	Pre-execution signoff, exact-action binding, refusal or interruption evidence, quorum where configured, and one-time consumption.	Oversight-design adequacy, authority assignment, automation-bias controls, safe-state design, and comprehension.
Articles 9, 11, 15	Supporting policy, technical-documentation, adversarial-test, and control-operation evidence.	System-level risk management, documentation, accuracy, robustness, cybersecurity, and conformity assessment.

ASSESSMENT QUESTIONS THE EVIDENCE SHOULD SURVIVE

- Was the signer key pinned outside the artifact?
- Did the signature cover the exact material action fields?
- Were initiator exclusion and distinct-human quorum enforced where required?
- Do mutation, replay, stale authority, policy mismatch, and unavailable state refuse?
- Can an outside party reproduce the result from the retained export?

RE-PERFORM THE CORE CHECK

`npx @emilia-protocol/verify receipt.json`

The Commission's current timeline lists Annex III high-risk rules from 2 December 2027 and product-integrated high-risk rules from 2 August 2028.

Supports an assessment; does not certify compliance.
