

THE ACCEPTANCE LAYER FOR AGENT ACTIONS

AI agents are moving from producing text to taking irreversible actions.
EMILIA is the open, neutral layer that answers the one question every
relying party is about to ask: can I rely on this action?

No proof, no action.

AGENTS ARE ABOUT TO MOVE MONEY, DENY CARE, EXPORT DATA, AND CHANGE PRODUCTION

The industry is racing to give agents identity, transport, and tools. Every one of those answers who is calling and how. None of them answers whether a specific, accountable human authorized the exact irreversible action, and whether anyone downstream should rely on it.

\$0

cost to verify an EMILIA receipt:
offline, no callback

1 gap

no neutral answer to "is this
action safe to rely on"

EVERYONE IS BUILDING ARTIFACTS. NO ONE BUILT THE COURT THAT SAYS WHICH ONES COUNT.

IDENTITY

Which agent is calling

Workload identity, transport, discovery.
Necessary, and crowded.

ARTIFACTS

What was produced

Receipts, permits, logs, mandates.
Proof that something happened.

ACCEPTANCE

Can I rely on it

Admissible under my policy, my
auditor, my liability model. Unowned.
This is EMILIA.

A PORTABLE RECEIPT PROVING A NAMED HUMAN AUTHORIZED AN EXACT ACTION

- **Signed by the approver**, over the exact canonical action, verifiable offline against pinned keys with no callback to us or to the operator.
- **A reliance verdict, not just a signature**. A pinned policy decides who counts, what evidence is required, and how fresh it must be. The kernel returns rely, or a specific reason not to.
- **Honest by design**. It states plainly what it does not prove. Verified is never the same as accepted, and the protocol keeps them separate.

FROM AN ACTION TO AN ANSWER A STRANGER CAN REPRODUCE

01

Authorize

A named human signs the exact action. Two-person rule for the highest-stakes decisions.

02

Bind

The receipt binds the approver to the action by digest. Portable, self-contained.

03

Rely

A relying party checks it against its pinned profile. Rely, or a closed reason not to.

04

Reperform

An auditor re-runs the exact check offline, months later, and gets the exact same verdict.

The disputed fact stops being reconstructed under deadline and becomes something both sides read the same way.

A receipt a vendor controls is still the vendor's to be doubted. Only a format the customer's auditor can verify without trusting anyone is real third-party evidence.

EMILIA is that neutral format. Apache-2.0, offline-verifiable, no paid tier on the core.

Neutrality is the one property an incumbent cannot build for itself, and it compounds: every party that verifies a receipt makes the format harder to route around.

THIS IS RUNNING INFRASTRUCTURE, NOT A FORECAST

SHIPPED

Reference verifiers live on npm and PyPI. A reliance preflight runs today: `npx @emilia-protocol/verify reliance-gap`.

STANDARDS

Thirteen individual Internet-Drafts posted on the IETF datatracker, with more render-clean and ready to file.

ADOPTION SIGNALS

A contribution to Microsoft's AI Agents curriculum approved by the lesson author. A human-authorization element filed with NCPDP, presenting in Denver in August.

INDEPENDENT INTEROP

A second implementation, built from the spec by an outside party, ran cross-implementation reliance verdicts, including a device-verified approval gating a live-shaped grid curtailment action.

HIGH-LIABILITY, MULTI-PARTY, IRREVERSIBLE

HEALTHCARE

Pharmacy authority

Prior authorization, denials, appeals. A standards element filed with NCPDP.

AUDIT

Reperformable assurance

Evidence an auditor re-runs instead of trusting. A service line firms can sell.

ENERGY

Grid actions

Curtailment gated by device-verified human authority. Demonstrated in interop.

COMMERCE

Agentic payments

Approval bound to the exact action, portable across the parties in a transaction.

GOVERNMENT

Benefits and oversight

Authority and revocation made checkable offline by any relying party.

PLATFORMS

Agent tool safety

A firewall between agents and consequential tools: no admissible proof, no action.

FREE RECEIPTS. PAID CERTAINTY. AN OWNED REGISTRY.

OPEN Free forever The receipt format and offline verification. This wins legitimacy and adoption.	PAID Certification and enterprise Certifying a party's receipts under a published profile, enterprise gate, regulated vertical profiles, assurance packages.	MOAT The acceptance registry The neutral registry and root program that high-stakes automated actions depend on. Where the category consolidates.
--	---	--

The path to scale is not license fees alone. It is becoming the neutral layer that regulated, high-value automated actions are required to pass through.

THE ASK

WE ARE RAISING A SEED ROUND TO MAKE EMILIA THE STANDARD FOR ACCEPTING AGENT ACTIONS

The protocol is built and running. The next chapter is enterprise deployment, standards leadership, and the vertical wedges in healthcare, audit, and energy that turn a neutral format into required infrastructure.
