

Proof before the agent acts.

The open authorization-receipt layer for irreversible AI-agent actions.

SEED FINANCING

\$3.0M

\$21M post-money cap

18-month plan to convert protocol proof into external implementation, reliance, and pilots.

The next control plane is not access. It is evidence.

Agents are moving from suggestions to system mutations. The missing layer is portable proof that a responsible human authorized the exact action.

01 — Agent actions are becoming real.

Money, code, records, permissions, and infrastructure are entering the tool layer.

02 — Runtime logs do not travel.

Auditors, insurers, counterparties, and regulators need evidence outside the operator's control plane.

03 — Receipts become the standard artifact.

EMILIA makes human authorization verifiable offline, before irreversible execution.

The action layer is funded. The evidence gap is ours.

A secure-action category now has venture capital behind it. The unresolved problem is reliance: proving who authorized the exact action before it changed a system of record.

Access-control runtime

Can the agent act as this user?

Portable authorization evidence

Who approved this exact action? ← EMILIA

Sources: WSJ CIO Journal funding report; Arcade public materials. Arcade valuation is not public.

A local approval log is not enough once action crosses trust boundaries.

Agentic systems split approval, execution, mutation, and later reliance across different parties.

"Approved" in one vendor log is testimony. A signed receipt is evidence.

EMILIA creates a receipt anyone can verify offline.

The artifact binds identity, action, policy, display context, assurance, quorum, and one-time consumption.

TRUST RECEIPT

action_hash	sha256:8e4a...
display_hash	sha256:9f2c...
approver	jchen · passkey verified
policy_hash	sha256:2aa1...
consume	one-time

Verifies without trusting the agent, the tool runtime, the system operator, or EMILIA.

Tamper the action, change the policy, replay the receipt, use the wrong approver, or forge the signature — verification fails.

EMILIA complements every runtime — it standardizes the proof they cannot own.

The winning protocol sits above Arcade, MCP servers, OpenAI tool calls, internal agents, and custom approval systems.

Customers

Access control decides whether an agent may act. EMILIA proves a human authorized the action that matters.

This is running code, not a slideware protocol.

The core has enough technical maturity for seed investors to underwrite adoption risk rather than feasibility risk.

3

JS / Python / Go verifiers

RR-1

receipt-required conformance

Open-standard posture

Apache-2.0 core · active individual Internet-Drafts · public conformance vectors · a developer rail for gating dangerous actions.

The wedge is one dangerous action protected in ten minutes.

Receipt Required turns the protocol into a copyable developer moment: missing receipt refuses, valid receipt runs, replay and forgery fail.

REFUSE

replay / forgery

The first adoption event is not a press release. It is a merged guard in someone else's repo.

Open-standard distribution; paid assurance operations.

The schema stays open. The managed product monetizes the trust operations enterprises do not want to run themselves.

FREE — Protocol + verifiers

Receipt format, conformance tests, SDKs, examples, Internet-Drafts.

PAID — Managed Gate

Issuer service, approver directory, policy packs, transparency log, evidence dashboard, retention.

\$25K–\$150K initial ACV target; vertical pilots expand with compliance packaging and air-gapped support.

The round finances proof events, not generic awareness.

The company re-rates when outsiders implement it, rely on it, and pilot it.

0–3 mo

Implementation

Land the first external merged Receipt
Required guard or adapter.

3–9 mo

Reliance

Secure written auditor / insurer / CISO
reliance feedback.

9–18 mo

Pilot

Observe-mode deployment with a path to
fail-closed enforcement.

North-star KPI: one external implementation plus one written reliance event.

Raise \$3.0M at a \$21M post-money cap to reach Series A proof.

A premium seed price for the protocol asset, discounted for the adoption risk still ahead.

\$0.40M

Security / audit

\$0.35M

Pilots / compliance

\$0.25M

Ops / reserve

\$30M post-money is the stretch price to earn after an anchor, reliance letter, or signed pilot.

THE ASK

Lead the evidence layer before agent actions become regulated infrastructure.

Commit to seed diligence, validate the \$21M post-money cap, and help open the first three reliance doors: one regulated buyer, one auditor or insurer, and one runtime / platform partner.

No receipt. No execution.

Source notes.

Investor-facing claims are separated from financing assumptions.

Arcade benchmark

WSJ CIO Journal reported Arcade's \$60M Series A, \$72M total funding, SYN Ventures lead, Morgan Stanley and Wipro participation, and ~40 employees. Arcade valuation is not public.

EMILIA technical proof

EMILIA public repo and docs: automated tests, TLA+ properties, Alloy facts/assertions, JS/Python/Go verifiers, RR-1 conformance, active individual Internet-Drafts.

Financing terms

\$3.0M raise, \$21M post-money cap, use-of-proceeds budget, ACV targets, and Series A bridge are management/banker planning assumptions, not source-backed market facts.

Language guardrail: active individual Internet-Drafts seeking review — not an IETF standard or endorsement.
