

The control Report 2025-601 implies — made verifiable.

Report 2025-601 keeps EDD on the high-risk list with more than **\$500 million** in estimated fraudulent UI payments in 2024 alone. The recurring root failure across the findings is the same: money moved without a verifiable record that a **named, authorized person** approved the specific high-risk action **before** it executed. EMILIA makes exactly that record checkable.

WHAT EMILIA IS

An **open standard** (Apache-2.0, with an IETF Internet-Draft) that produces a signed, tamper-evident **authorization receipt**: a record binding *who approved · the exact action and parameters · the policy version · a timestamp · one-time use* — created before execution and verifiable **independently and offline**, with open-source code, without trusting EDD or EMILIA. It is not a product we are selling and requires no procurement to evaluate.

MAPPING TO THE FAILURE PATTERN THE AUDIT WILL EXAMINE

WHAT REPORT 2025-601 DOCUMENTS	THE CONTROL AN EP RECEIPT PROVIDES
Payments and claim changes issued without a verifiable record of who authorized them	A named-approver receipt is required and bound to the exact action <i>before</i> disbursement — no receipt, no execution
Inability, after the fact, to establish who authorized a specific high-risk action	Each receipt names the responsible principal and is cryptographically bound to that one action — auditable years later, offline
Weak controls on high-risk changes (bank-account, identity, eligibility overrides)	Action-scoped receipts with amount/risk escalation tiers (e.g. single- vs. dual-approval) enforced before the change lands
Authorization evidence that lives only inside the issuing system and can be altered	Tamper-evident and portable — any reviewer re-verifies it with published open-source tooling, independent of the source system

WHAT THE AUDIT TEAM CAN TRY TODAY — ZERO PROCUREMENT, IN A BROWSER

Approve one yourself
emiliaprotocol.ai/try

A 20-second Face ID approval; watch the receipt verify, then watch a tampered copy get rejected.

Observe-mode sandbox
emiliaprotocol.ai/govguard

Run sample benefit-style actions and get an "N of M would have been held for a named human" report — no integration.

Verify independently
[npm @emilia-protocol/verify](https://npmjs.com/@emilia-protocol/verify)

Re-check any receipt offline from the command line; verifiers also published in three languages.

HONEST BOUNDARY

An EP receipt proves, offline, that a named principal authorized the exact action under a stated policy, and that the record has not been altered. **One-time-use and revocation are server-side state the issuing agency maintains** — the right audit question is whether the agency enforces them, and EP gives the auditor the artifact to ask against. EP adds a verifiable evidence layer; it does not replace EDD's identity or eligibility systems.
